

Figure 10 The mains-on delay ensures that the switch-on current remains within certain limit Two of these delays are required for each Titan 2000

Figure 11. Printed-circuit board for the mains-on delay circuit, which is not available ready made.

The delay arranges for the load, that is, the Titan 2000, to be switched on in two stages. In the first of these, the switch-on current is limited by series network $\mathrm{R}_{4}-\mathrm{R}_{7}$. After the delay determined by capacitors $\mathrm{C}_{2}$ and $\mathrm{C}_{3}$, the series network is shorted by a relay contact, whereupon the full current flows between $\mathrm{K}_{1}$ and $\mathrm{K}_{2}$.

Relay $\mathrm{Re}_{1}$ can switch up to 2000 VA . Its supply voltage is obtained from the mains with the aid of rectifier $B_{1}$, capacitor $\mathrm{C}_{1}$ and resistor $\mathrm{R}_{3}$.

Since the amplifier power supply uses two mains transformers, two mains- on delay circuits are needed.

Fuse $F_{1}$ functions as a primary mains fuse for the amplifier.

Capacitor $C_{1}$ is a metallized paper type intended especially for use with mains voltage applications.

Bear in mind that the circuit is linked directly to the mains supply and thus carries lethal voltages.

Next month's third instalment of this article deals with the construction of the amplifier, a few other practical matters, and some measurements.

## Parts lists

Mains-on delay circuit
Resistors:
$\mathrm{R}_{1}, \mathrm{R}_{2}=470 \mathrm{k} \Omega$
$\mathrm{R}_{3}=220 \Omega$
$\mathrm{R}_{4}-\mathrm{R}_{7}=10 \Omega, 5 \mathrm{~W}$
Capacitors:
$\mathrm{C}_{1}=0.33 \mu \mathrm{~F}, 300 \mathrm{~V}$ a.c.
$C_{2}, C_{3}=470 \mu \mathrm{~F}, 40 \mathrm{~V}$

## Miscellaneous:

$\mathrm{K}_{1}, \mathrm{~K}_{2}=2$-way terminal block, pitch 7.5 mm
$\mathrm{B}_{1}=$ bridge rectifier, round, Type B250C 1500
$\mathrm{Re}_{1}=$ relay, coil $12 \mathrm{~V}, 1200 \Omega$; contact rating $250 \mathrm{~V}, 8 \mathrm{~A}$
$\mathrm{F}_{1}=$ see text
