## BLOCK DIAGRAM

## Power On/Stand - by and Protection circuit

## 1. Power On/Stand - by

The power on/stand-by signal is output from pin 53 of the CPU. When the stand-by mode is selected the voltage of pin 53 changes from $\mathrm{Hi}(5 \mathrm{~V})$ to Low ( 0 V ), to turn off Q682, Q682 turning off causes Q683 and Q684 to turn off. +24V supply for vertical and horizonal output circuit, +9 V supply for IF/Video/Chroma circuit and +9 V for tuner circuit are all cut off, resulting in the TV set going into the stand -by mode.
When the TV is switched back into the power on mode, Q683 and Q684 are turned ON and the relevant voltage are supplied back to each circuit.

## Protection circuit (Hardware)

When a power failure is detected by diodes D643, D644, D645, D492, D445, D255 and D654, this protection circuit operates causing the power oscillation to stop.
If one of the above diodes is turned on, the voltage of Q631-emitter decreases,and it turns on completely. Photo-coupler D615 is driven by this and generates a current which drives Q612 on. As a result, the operation of the power oscillation circuit is stopped. Under normal circumstances these parts, D615, Q631, D641, R635, R636, VR631 are operating as the error detection and regulation circuit for +130V power supply.

## Power Consumption Saving Circuit

This chassis employs the interval oscillation circuit on the power circuit for saving the consumption of power supply circuit during the stand - by mode.
The interval oscillation circuit consists of Q685, Q686, D685 and peripheral circuit. Q685 and Q686 drives the photo - coupler D615 and oscillation of power circuit according to voltage level on point $(A)$ in the figure. During power - on mode, the voltage on point $(A)$ is almost 0 V and Q685 and Q686 maintain turning - off.
When the set switches into stand - by mode, the voltage on point (A) increases about 15 V . The voltage which is divided with R688 and R687 is applied to Q685 - base and drives Q685 and Q686 turning - on. When Q686 turns on, the photo - diode / transistor in D615 is completely turned on, then Q612 is turned on and Q613 is turned off. By this means, the oscillation of power circuit stops and the voltage of secondary power supply falls down. Also the voltage of point (A) falls down from 15 V gradually.
When the voltage on Q685-base is less than voltage of Q685-emitter, Q685 is turned off and then Q686 is off, then D615 and Q612 are turned off. Finally Q613 starts the oscillation and the voltages are supplied to the secondary circuit. By this means, the voltage on point (A) rises up and drives Q685 on again. By repeating the above operation, the power consumption in the stand - by mode can be saved.

## IF/Video/Chroma/Deflection

This following figure shows a block diagram of the IF/Video/Chroma/Deflection IC <TB1238AN> peripheral circuit.
The IF signal output from the tuner is amplified by the pre-amplifier Q101, then sent to the SAW(Surface Acoustic Wave) filter X131. The output signal of the SAW filter X131, is input to pins 6 and 7 . The IF signal thus input to the IC is then amplified by the IF amplifier, and is detected by the video detector with the VCO(Voltage Controlled Oscillation) circuit consisting of L137 and peripheral resistors, and it is output as a composite video signal at pin 47.

This composite video signal passes through the $6.0 \mathrm{MHz}(6.5 \mathrm{MHz}(\mathrm{D} / \mathrm{K})$ and $4.5 \mathrm{MHz}(\mathrm{M})$ sound bandpass filtering circuit, and it is input into pin 43 of IF IC201. In the IC, this sound IF signal passes through the SIF amplifier, FM detector and audio output circuit, and it is then output from pin 2 as audio drive signal.

## Video/Chroma stage

The composite video signal output from pin 47 of IC201, passes through the Q181 and the sound traps $\mathrm{X} 181(4.5 \mathrm{MHz}), \mathrm{X} 182(6.0 \mathrm{MHz})$ to reject the sound carrier components, is then supplied to pin 43 . The external video signal from the AV (SCART) terminal is supplied to pin 41. The video signal input to pin 43 or 41 is separated into the luminance $(Y)$ and chrominance $(C)$ signals in Ic201, and output as R,G,B at Pin nos. 18, 19, 20 which drives the CRT circuit.
The external RBG signals for the on-screen display or teletext display are input to pins 16(B), 15(G) and $14(R)$. In the $I C$, the internal $R, G, B$ signals and the external $R, G, B$ signals are mixed in the selection circuit driven by the blanking signal input to pin 13 , and finally output to pins 18, 19, and 20.

## Deflection stage

The horizontal drive pulse is sent from pin 32 and drives drive transistor Q431. The flyback pulse applied to Pin 30 The vertical sync, is generated by counting down the horizontal oscillation. The vertical drive pulse sent from pin 24 to pin 4 of IC501, vertical output IC<TA8403>.
This IC has the automatic selection circuit for vertical sync. signal cycle from 50 Hz or 60 Hz .
It outputs the result to pin 41.

## Audio Output

Audio O/P from Pin 2 of I 201 is given as I/P to Pin 2 of AudioICI 001 (TA 8213K). The O/P from Pin 6 of the AUDIO IC drives the speakers. Mute is software Controlled through I ${ }^{2}$ C BUS.

## Vertical output

This chassis employs TD8403K for the Vertical Output Circuit.
The Vertical Trigger Pulse is driven by the negative polarity sync pulse from the I201. The ramp generator circuit generates the vertical deflection sawtooth waveform. This ramp signal drives the vertical drive circuit. In the first half of scanning period, a deflecting on current current is sent from pin $2 \&$ passes through the following path.
$\mathrm{V}_{\mathrm{CC}} \rightarrow \mathrm{PIN} \rightarrow \quad \rightarrow \mathrm{C} 50 \rightarrow \mathrm{R} 506$
electricharg thestore C308In lashal of scanninperiod currenis
C50 $\rightarrow$ pin $\rightarrow$ PIN1(GND $\rightarrow$ R506
In this way, an increasing sawtooth waveform current flows directly to the Dy to perform electron beam deflection. During the first half of the blanking priod, the vertical ramp signal suddenly turns off. Since there is no longer any current flowing into the DY the magnetic field collapses causing an induced current to flow as follows
$D Y \rightarrow$ Pin $2 \rightarrow$ pin1 $\rightarrow$ R506 $\rightarrow$ C506 $\rightarrow$ DY

## SIF Filtering Circuit

The video signal which also contains the SIF signal is output from pin 47 of IC201 and is supplied to the base of the buffer transistor Q181. The SIF signal output from Q181 is supplied to pin 53 of IC201 through the sound bandpass filtering circuit. The relevant bandpass filters X153 ( 4.5 MHz ), X152 $(5.5 \mathrm{MHz})$ are selected according to the output signals from pins $9,10,11$, of the CPU. The SIF signal is then fed via the relevant buffer Q155 $(4.5 \mathrm{MHz})$, Q156 $(5.5 \mathrm{MHz})$ to the SIF input pin 530 IC201 for de-modulation.

## CPU - ST 92195 B6B1 / St92185

The following figure shows a block diagram of the CPU peripheral circuit.

## Horiz./Vert. pulse input

The vertical and horizontal pulses from the deflection circuits are input to pins 2 and 1 in order to synchronise the on screen display.
The vertical pulse is supplied from pin 41 of IC801 through the and inverter circuit (Q803)
The horizontal pulse is supplied from pin 4 of the flyback transformer through the inverter circuit Q802. If one of these pulses is not supplied to the CPU, the on-screen display cannot be displayed.

## HORIZONTAL OUTPUT

The horizontal oscillation signal is output from pin 32 of IC201 and used to switch the driver transistor Q431. This switching signal is current amplified by the driver transformerT431 and drives the output transistor Q432. When Q432 turns ON, an increasing current flows directly to the DY through L441 $\rightarrow$ DY
Q432-C $\rightarrow$ Q432-E and the deflection occurs during the last half of the scanning period. When Q402 turns OFF, the magnetic field stored in the DY up to that point causes a resonant current to flow into the capacitor C405 and charges them. The current stored in C435 then flows back to the DY causing an opposite magnetic field to be stored in the DY. This field then collapses increasing a current which switches the damper diode in Q432 ON.The resonance state is completed, and an increasing current then flows again directly to the DY through the damper diode. By this means, the deflection in the first half of the scanning period is performed. When Q432 turns ON at the end of the first half of the scanning period, the deflection during the last half is begun, thus completing one cycle.

SERVICE ADJUSTMENTS LOCATION

## CRT UNIT

## 1. Service adjustments with replacing Memory IC (IC802)

1. Press and hold Recall button on RC for more than 6 seconds screen display will be as shown below.

Child lock off
Plug \& Play
Special menu on
GO to Plug and Play using P+, press volume + on RC then a blinking display "clearing please wait" appears as shown below

Child lock off
Plug \& Play
Special menu on
Clearing please wait
Now all the skipped and child locked programmes will be Cleared and Plug \& Play will be Enabled.
Check for Tuning Lock ON / OFF, Volume Lock ON / OFF, Blue Back ON / OFF, Music Mode ON / OFF, Stand by ON / OFF. After checking ensure Tuning, Volume, Blueback, Music, Standby are in OFF condition.
Following shows the initial conditions after clear execution.

| Blue back | ON |
| :--- | :--- |
| Colour | 31 |
| Brightness | 31 |
| Contrast | 63 |
| Sharpness | 31 |
| Volume | 17 |
| Volume lock | OFF |
| Tuning lock | OFF |
| Plug \& Play | Enable |

2. After a new memory IC is replaced the following are the default values that micro controller writes in to EEPROM.

## ENTRY IN TO SERVICE MODE

Press menu button on TV set and then press button 1 on RC we enter Service mode the following adjustments are possible with Service Mode. $\mathrm{P}+/-$ used to change the item $\& \mathrm{~V}+/-$ varies the data. To exit press menu button on RC / set.

## Default values

| 1. | Vco coarse | IF alignment | 127 |
| :--- | :--- | :--- | :--- |
| 2. | Vamp $(50 \mathrm{~Hz})$ | Vertical height adjustment | 050 |
| 3 | Vpos | Vertical position adjustment | 003 |
| 4 | Hpos | Horizontal position adjustment | 015 |
| 5 | Hposd | Horizontal osd position | 070 |
| 6 | White bal | Ensure thin white line | 000 |
| 7 | Blue gain | Blue gain adjustment | 063 |
| 8 | Green gain | Green gain adjustment | 063 |
| 9 | B - cutoff | Blue cutoff adjustment | 000 |
| 10 | G- cutoff | Green cutoff adjustment | 000 |
| 11 | R-cutoff | Red cutoff adjustment | 000 |
| 12 | Thin line | Thin line mode | 000 |
| 13 | Agc | Agc adjustment | 031 |

## Entry in to Factory Mode

Press menu button on TV set and then press button 2 on RC we enter Factory Mode the following adjustments are possible with Factory mode. $\mathrm{P}+/-$ used to change the item $\& \mathrm{~V}+/-$ varies the data. To exit press menu button on RC / set.

|  |  |  | Default data |
| ---: | :--- | :--- | :---: |
| 1. | Vco coarse | IF alignment | 127 |
| 2. | Wide | Wide mode height setting | 040 |
| 3 | Zoom | Zoom mode height setting | 055 |
| * | Secam B-Y adj. | Secam adjustment | 008 |
| $* 5$ | Secam R-Y adj | Secam adjustment | 008 |
| $* 6$ | Sub contrast | Sub contrast adjustment | 008 |
| $* 7$ | ABL strt, gain | ABL start \& gain adjustment | 000 |
| *8 | RGB contrast | Osd contrast | 031 |
| 9 | Vpososd | Osd vertical position adjustment | 001 |
| *10 | Mode 2 | Sound system | 001 |
| *11 | Mode 1 | Colour system | 002 |
| 12 | VS correction | Vertical S- correction adjustment | 007 |
| 13 | Vlinearity | Vertical linearity adjustment | 007 |
| 14 | Vamp (50 hz) | Vertical height adjustment | 050 |
| 15 | Vpos | Vertical position adjustment | 003 |
| 16 | Hpos | Horizontal position adjustment | 015 |
| 17 | Hposd | Horizontal osd position | 070 |
| 18 | White bal | Ensure thin white line | 000 |
| 19 | Blue gain | Blue gain adjustment | 063 |
| 20 | Green gain | Green gain adjustment | 063 |
| 21 | B- cutoff | Blue cutoff adjustment | 000 |
| 22 | G-cutoff | Green cutoff adjustment | 000 |
| 23 | R-cutoff | Red cutoff adjustment | 000 |
| 24 | Thin line | Thin line mode | 000 |
| 25 | AGC | AGC adjustment | 031 |

Note:- Ensure that * Data are same as default data

## Entry in to VSM (Video status memory) mode

Press menu button on TV set and then press button 3 on RC we enter VSM mode the following adjustments are possible with VSM mode. $\mathrm{P}+/-$ used to change the item \& $\mathrm{V}+/-$ varies the data. To exit press menu button on RC / set.

## Default data

| 1 | Dy bri | Dynamic brightness | 038 |
| :--- | :--- | :--- | :--- |
| 2 | Dy col | Dynamic colour | 032 |
| 3 | Dy con | Dynamic contrast | 063 |
| 4 | Dy shp | Dynamic sharpness | 044 |
| 5 | NA bri | Natural brightness | 032 |
| 6 | NA col | Natural colour | 032 |
| 7 | NA con | Natural contrast | 051 |
| 8 | NA shp | Natural sharpness | 032 |
| 9 | SO bri | Soft brightness | 032 |
| 10 | SO col | Soft colour | 032 |
| 11 | SO con | Soft contrast | 025 |
| 12 | SO shp | Soft sharpness | 019 |

NOTE :-Do not adjust the default data of Dynamic, Natural, Soft.
