

LM2611 1.4-MHz Cuk Converter

1 Features

- 1.4-MHz Switching Frequency
- Low $R_{DS(ON)}$ DMOS FET
- 1-mVp-p Output Ripple
- -5 V at 300 mA From 5-V Input
- Better Regulation Than a Charge Pump
- Uses Tiny Capacitors and Inductors
- Wide Input Range: 2.7 V to 14 V
- Low Shutdown Current: <1 μ A
- 5-Pin SOT-23 Package

2 Applications

- MR Head Bias
- Digital Camera CCD Bias
- LCD Bias
- GaAs FET Bias
- Positive to Negative Conversion

3 Description

The LM2611 is a current mode, PWM inverting switching regulator. Operating from a 2.7-V to 4-V supply, it is capable of producing a regulated negative output voltage of up to $-(36 V_{IN(MAX)})$. The LM2611 utilizes an input and output inductor, which enables low voltage ripple and RMS current on both the input and the output. With a switching frequency of 1.4 MHz, the inductors and output capacitor can be physically small and low cost. High efficiency is achieved through the use of a low $R_{DS(ON)}$ FET.

The LM2611 features a shutdown pin, which can be activated when the part is not needed to lower the I_q and save battery life. A negative feedback (NFB) pin provides a simple method of setting the output voltage, using just two resistors. Cycle-by-cycle current limiting and internal compensation further simplify the use of the LM2611.

The LM2611 is available as a small 5-pin, SOT-23 package and comes in two grades. Grade A has a 1.2-A current limit and 0.5- Ω $R_{DS(ON)}$, and Grade B has a 0.9-A current limit and 0.7- Ω $R_{DS(ON)}$.

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
1	SW	A	Drain of internal switch. Connect at the node of the input inductor and Cuk capacitor.
2	GND	GND	Analog and power ground.
3	NFB	A	Negative feedback. Connect to output via external resistor divider to set output voltage.
4	$\overline{\text{SHDN}}$	I	Shutdown control input. V_{IN} = Device on. Ground = Device in shutdown.
5	V_{IN}	PWR	Analog and power input. Filter out high frequency noise with a 0.1- μF ceramic capacitor placed close to the pin.

(1) A = Analog, I = Input, GND = Ground, PWR = Power

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Input voltage, V_{IN}		14.5	V
SW voltage	-0.4	36	V
NFB voltage	-6	0.4	V
$\overline{\text{SHDN}}$ voltage	-0.4	14.5	V
Maximum junction temperature		125	°C
Power dissipation ⁽²⁾	Internally limited		
Lead temperature		300	°C
Storage temperature, T_{stg}	-65	150	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- The maximum allowable power dissipation is a function of the maximum junction temperature, $T_{\text{J(MAX)}}$, the junction-to-ambient thermal resistance, θ_{JA} , and the ambient temperature, T_{A} . See the *Electrical Characteristics* table for the thermal resistance of various layouts. The maximum allowable power dissipation at any ambient temperature is calculated using: $P_{\text{D (MAX)}} = (T_{\text{J(MAX)}} - T_{\text{A}})/\theta_{\text{JA}}$. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown.

6.2 ESD Ratings

		VALUE	UNIT
$V_{\text{(ESD)}}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾⁽²⁾	± 2000
		Machine Model (MM) ⁽³⁾	± 200

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- The human body model is a 100-pF capacitor discharged through a 1.5-k Ω resistor into each pin.
- The machine model is a 200-pF capacitor discharged directly into each pin.

6.3 Recommended Operating Conditions

	MIN	NOM	MAX	UNIT
Supply voltage	2.7		14	V
Operating junction temperature, T_J	-40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LM2611	UNIT
		DBV (SOT-23)	
		5 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	163.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	115.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	27.4	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	12.9	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	26.9	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

Specifications in standard type face are for $T_J = 25^\circ\text{C}$, unless otherwise specified. $V_{IN} = 5\text{ V}$ and $I_L = 0\text{ A}$, unless otherwise specified.

PARAMETER	TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
V_{IN}	Input voltage	$T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		14	V
I_{SW}	Switch current limit	Grade A		1.2	A
		Grade A; $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		1	
		Grade B		0.9	
		Grade B; $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		0.7	
R_{DSON}	Switch ON resistance	Grade A		0.5	Ω
		Grade B		0.7	
$SHDN_{TH}$	Shutdown threshold	Device enabled; $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		1.5	V
		Device disabled; $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		0.5	
I_{SHDN}	Shutdown pin bias current	$V_{SHDN} = 0\text{ V}$		0	μA
		$V_{SHDN} = 5\text{ V}$		0	
		$V_{SHDN} = 5\text{ V}; T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		1	
NFB	Negative feedback reference	$V_{IN} = 3\text{ V}$		-1.23	V
		$V_{IN} = 3\text{ V}; T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		-1.205	
I_{NFB}	NFB pin bias current	$V_{NFB} = -1.23\text{ V}$		-4.7	μA
		$V_{NFB} = -1.23\text{ V}; T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		-2.7	
I_q	Quiescent current	$V_{SHDN} = 5\text{ V}$, Switching		1.8	mA
		$V_{SHDN} = 5\text{ V}$, Switching; $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		3.5	
		$V_{SHDN} = 5\text{ V}$, Not Switching		270	μA
		$V_{SHDN} = 5\text{ V}$, Not Switching; $T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		500	
		$V_{SHDN} = 0\text{ V}$		0.024	μA
		$V_{SHDN} = 0\text{ V}; T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		1	
$\%V_{OUT}/\Delta V_{IN}$	Reference line regulation	$2.7\text{ V} \leq V_{IN} \leq 14\text{ V}$		0.02	%/V

- (1) All limits are specified at room temperature (standard typeface) and at temperature extremes (bold typeface). All room temperature limits are 100% tested through statistical analysis. All limits at temperature extremes via correlation using standard Statistical Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (2) Typical numbers are at 25°C and represent the expected value of the parameter.

Electrical Characteristics (continued)

Specifications in standard type face are for $T_J = 25^\circ\text{C}$, unless otherwise specified. $V_{IN} = 5\text{ V}$ and $I_L = 0\text{ A}$, unless otherwise specified.

PARAMETER		TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
f_S	Switching frequency	$T_J = 25^\circ\text{C}$		1.4		MHz
		$T_J = -40^\circ\text{C to } +85^\circ\text{C}$	1		1.8	
D_{MAX}	Maximum duty cycle	$T_J = 25^\circ\text{C}$		88%		
		$T_J = -40^\circ\text{C to } +85^\circ\text{C}$	82%			
I_L	Switch leakage	$V_{SW} = 5\text{ V}$, Not Switching			1	μA

7 Detailed Description

7.1 Overview

The LM2611 consists of a current mode controller with an integrated primary switch and integrated current sensing circuitry. The feedback is connected to the internal error amplifier and a type II/III internal compensation scheme is used. A ramp generator provides some slope compensation to the system. SHDN pin is a logic input designed to shut down the converter.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Cuk Converter

Figure 13. Operating Cycles of a Cuk Converter

The LM2611 is a current mode, fixed frequency PWM switching regulator with a -1.23-V reference that makes it ideal for use in a Cuk converter. The Cuk converter inverts the input and can step up or step down the absolute value. Using inductors on both the input and output, the Cuk converter produces very little input and output current ripple. This is a significant advantage over other inverting topologies such as the buck-boost and flyback.

The operating states of the Cuk converter are shown in Figure 13. During the first cycle, the transistor switch is closed and the diode is open. $L1$ is charged by the source and $L2$ is charged by C_{CUK} , while the output current is provided by $L2$. In the second cycle, $L1$ charges C_{CUK} and $L2$ discharges through the load. By applying the volt-second balance to either of the inductors, use Equation 1 to determine the relationship of V_{OUT} to the duty cycle (D).

Feature Description (continued)

$$V_{OUT} = -V_{IN} \frac{D}{1-D} \tag{1}$$

The following sections review the steady-state design of the LM2611 Cuk converter.

7.3.2 Output and Input Inductor

Figure 14 and Figure 15 show the steady-state voltage and current waveforms for L1 and L2, respectively. Referring to Figure 13 (a), when the switch is closed, V_{IN} is applied across L1. In the next cycle, the switch opens and the diode becomes forward biased, and V_{OUT} is applied across L1 (the voltage across C_{CUK} is $V_{IN} - V_{OUT}$.)

Figure 14. Voltage and Current Waveforms in Inductor L1 of a Cuk Converter

The voltage and current waveforms of inductor L2 are shown in Figure 15. During the first cycle of operation, when the switch is closed, V_{IN} is applied across L2. When the switch opens, V_{OUT} is applied across L2.

Figure 15. Schematic of the Cuk Converter Using LM2611

Equation 2 to Equation 5 define the values given in Figure 14 and Figure 15:

$$I_{L2} = I_{OUT} \tag{2}$$

Feature Description (continued)

$$\Delta i_{L2} = \frac{V_{IN} \times D \times T_S}{2 \times L_2} \quad (3)$$

$$I_{L1} = \frac{D}{1-D} I_{L2} = \frac{D}{1-D} I_{OUT} \quad (4)$$

$$\Delta i_{L1} = \frac{V_{IN} \times D \times T_S}{2 \times L_1} \quad (5)$$

Use these equations to choose correct core sizes for the inductors. The design of the LM2611's internal compensation assumes L1 and L2 are equal to 10 to 22 μH , thus TI recommends staying within this range.

7.3.3 Switch Current Limit

The LM2611 incorporates a separate current limit comparator, making current limit independent of any other variables. The current limit comparator measures the switch current versus a reference that represents current limit. If at any time the switch current surpasses the current limit, the switch opens until the next switching period. To determine the maximum load for a given set of conditions, both the input and output inductor currents must be considered. The switch current is equal to $i_{L1} + i_{L2}$, and is drawn in Figure 16. In summary, Equation 6 shows:

$$\begin{aligned} I_{SW(PEAK)} &= I_{L1} + I_{L2} = I_{L1} + I_{L2} + \Delta i_{L1} + \Delta i_{L2} \\ &= I_{OUT} \times \left(1 + \frac{D}{1-D}\right) + \frac{V_{IN} \times D \times T_S}{2} \times \left(\frac{1}{L_1} + \frac{1}{L_2}\right) \end{aligned} \quad (6)$$

$I_{SW(PEAK)}$ must be less than the current limit (1.2 A typical), but will also be limited by the thermal resistivity of the LM2611 device's 5-pin, SOT-23 package ($\theta_{JA} = 265^\circ\text{C/W}$).

The peak value is equal to the sum of the average currents through L1 and L2 and the average-to-peak current ripples through L1 and L2.

Figure 16. Switch Current Waveform in a Cuk Converter.

7.3.4 Input Capacitor

The input current waveform to a Cuk converter is continuous and triangular, as shown in Figure 14. The input inductor insures that the input capacitor sees fairly low ripple currents. However, as the input inductor gets smaller, the input ripple goes up. The RMS current in the input capacitor is shown in Equation 7.

$$I_{CIN(RMS)} = \frac{1}{2\sqrt{3}} \frac{V_{IN}}{f_s L_1 \left(\frac{V_i}{|V_o|} + 1 \right)} \quad (7)$$

The input capacitor should be capable of handling the RMS current. Although the input capacitor is not so critical in a Cuk converter, a 10- μF or higher value good quality capacitor prevents any impedance interactions with the input supply. TI recommends connecting a 0.1- μF or 1- μF ceramic bypass capacitor on the V_{IN} pin (pin 5) of the IC. This capacitor must be connected very close to pin 5 (within 0.2 inches).

Feature Description (continued)

7.3.5 Output Capacitor

Like the input current, the output current is also continuous, triangular, and has low ripple (see I_{L2} in [Figure 15](#)). The output capacitor must be rated to handle its RMS current:

$$I_{\text{COUT(RMS)}} = \frac{\Delta i_{L2}}{\sqrt{3}} = \frac{1}{2\sqrt{3}} \frac{V_{\text{IN}}}{f_s L_2 \left(\frac{V_i}{|V_o|} + 1 \right)} \quad (8)$$

For example, $I_{\text{COUT(RMS)}}$ can range from 30 mA to 180 mA with $10 \mu\text{H} \leq L_{1,2} \leq 22 \mu\text{H}$, $-10 \text{ V} \leq V_{\text{OUT}} \leq -3.3 \text{ V}$, and $2.7 \text{ V} \leq V_{\text{IN}} \leq 30 \text{ V}$ (V_{IN} may be 30 V if using separate power and analog supplies, see [Split Supply Operation](#) in the [Typical Application](#) section). The worst case conditions are with $L_{1,2}$, $V_{\text{OUT(MAX)}}$, and $V_{\text{IN(MAX)}}$. Many capacitor technologies will provide this level of RMS current, but ceramic capacitors are ideally suited for the LM2611. Ceramic capacitors provide a good combination of capacitance and equivalent series resistance (ESR) to keep the zero formed by the capacitance and ESR at high frequencies. Use [Equation 9](#) to calculate the ESR zero.

$$f_{\text{ESR}} = \frac{1}{2\pi C_{\text{OUT}} \text{ESR}} \text{ (Hz)} \quad (9)$$

A general rule of thumb is to keep $f_{\text{ESR}} > 80 \text{ kHz}$ for LM2611 Cuk designs. Low ESR tantalum capacitors will usually be rated for at least 180 mA in a voltage rating of 10 V or above. However the ESR in a tantalum capacitor (even in a low ESR tantalum capacitor) is much higher than in a ceramic capacitor and could place f_{ESR} low enough to cause the LM2611 to become unstable.

7.3.6 Improving Transient Response and Compensation

The compensator in the LM2611 is internal. However, a zero-pole pair can be added to the open-loop frequency response by inserting a feed-forward capacitor, C_{FF} , in parallel to the top feedback resistor (R_{FB1}). Phase margin and bandwidth can be improved with the added zero-pole pair. This in turn improves the transient response to a step load change (see [Figure 17](#) and [Figure 18](#)). The position of the zero-pole pair is a function of the feedback resistors and the capacitor value:

$$\omega_z = \frac{1}{C_{\text{FF}} R_{\text{FB1}}} \text{ (rad / s)} \quad (10)$$

$$\omega_p = \frac{1}{C_{\text{FF}} R_{\text{FB1}}} \left(1 + \frac{R_{\text{FB1}}}{R_{\text{FB2}}} \right) \text{ (rad / s)} \quad (11)$$

The optimal position for this zero-pole pair will vary with circuit parameters such as D , I_{OUT} , C_{OUT} , L_1 , L_2 , and C_{CUK} . For most cases, the value for the zero frequency is between 5 kHz to 20 kHz. Notice how the pole position, ω_p , is dependant on the feedback resistors R_{FB1} and R_{FB2} , and therefore also dependant on the output voltage. As the output voltage becomes closer to -1.26 V , the pole moves towards the zero, tending to cancel it out. If the absolute magnitude of the output voltage is less than 3.3 V, adding the zero-pole pair will not have much effect on the response.

Feature Description (continued)

7.4 Device Functional Modes
7.4.1 Hysteretic Mode

As the output current decreases, the energy stored in the Cuk capacitor eventually exceeds the energy required by the load. The excess energy is absorbed by the output capacitor, causing the output voltage to increase out of regulation. The LM2611 detects when this happens and enters a pulse-skipping, or hysteretic mode. In pulse-skipping mode, the output voltage increases as illustrated in Figure 20 as opposed to the regular PWM operation shown in Figure 19. Figure 19 shows the LM2611 in PWM Mode with very-low ripple. Figure 20 shows the LM2611 in pulse-skipping mode at low loads. In this mode, the output ripple increases slightly.

7.4.1.1 Thermal Shutdown

If the junction temperature of the LM2611 exceeds 163°C, the device enters thermal shutdown. In thermal shutdown, the part deactivates the driver and the switch turns off. The switch remains off until the junction temperature drops to 155°C, at which point the part begins switching again. It will typically take 10 ms for the junction temperature to drop from 163°C to 155°C with the switch off.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LM2611 is a Cuk controller with an integrated switch. The following section provides an approach to sizing the components for the target application and shows some typical examples of applications to help the designer.

8.2 Typical Application

8.2.1 Cuk Converter With Integrated Switch

Figure 21. Typical Cuk Converter Implementation Using LM2611

8.2.1.1 Design Requirements

The first variables needed are the output voltage and the input voltage range (min to max). The input voltage range ensures that the IC is suitable for the application and that the absolute maximum voltage are respected. The expected maximum output current is also needed to verify that the IC can deliver the required current.

8.2.1.2 Detailed Design Procedure

The first components to choose are the power inductors. Typically a smaller inductance yields a smaller solution footprint and lower cost but the higher ripple makes a smaller inductance not compatible with every application. Due to the internal compensation, TI recommends a 10- μ H to 22- μ H inductor. Try to choose the inductors so that the peak-to-peak ripple is lower than 0.3 A of the average current by using [Equation 3](#) and [Equation 5](#).

Using the maximum output current and the input voltage range, calculate the worst case peak current in the switch using [Equation 6](#). If the peak current is above the peak current limit for this part, consider increasing the inductance and re-calculate. If the inductance is above 22 μ H for each inductor, the designer will have to pay special attention to stability over the extended range of operation (it's always a good practice to do so even if the inductance is within the recommended range).

Using the desired output voltage, calculate the value of the feedback resistors. The reference voltage is 1.23 V. Resistors of 50 k Ω or less must be used due to the leakage at the NFB pin.

Typical Application (continued)

It is a good idea to add a placeholder for a small capacitor across the top feedback resistor to act as a feed-forward component to optimize transient response. Optimization of the feed-forward capacitor depends a lot on the specific parameters including the parasitic components associated with the capacitors. Experimentation is key to ensure ideal sizing of the capacitor (either using load transient response or a loop response analyzer). See [Improving Transient Response and Compensation](#) for details regarding the C_{FF} capacitor.

8.2.5 LM2611 Operating With Separate Power and Biasing Supplies

Figure 31. LM2611 Operating With Separate Power and Biasing Supplies Schematic

8.2.5.1 Design Requirements

Follow the design requirements in [Cuk Converter With Integrated Switch](#).

8.2.5.2 Detailed Design Procedure

8.2.5.2.1 Split Supply Operation

The LM2611 may be operated with separate power and bias supplies. In the circuit shown in [Figure 31](#), V_{IN} is the power supply that the regulated voltage is derived from, and V_{DD} is a low current supply used to bias the LM2611. [Equation 12](#) and [Equation 13](#) show the conditions for the supplies are:

$$2.7 \text{ V} \leq V_{DD} \leq 14 \text{ V} \quad (12)$$

$$0 \text{ V} \leq V_{IN} \leq (36 - I_{V_{OUT}}) \text{ V} \quad (13)$$

Typical Application (continued)

As the input voltage increases, the maximum output current capability increases. Using a separate, higher voltage supply for power conversion enables the LM2611 to provide higher output currents than it would with a single supply that is limited in voltage by $V_{IN(MAX)}$.

8.2.6 Shutdown and Soft-Start

Figure 32. LM2611 Soft-Start Circuit

8.2.6.1 Design Requirements

Follow the design requirements in [Cuk Converter With Integrated Switch](#).

8.2.6.2 Detailed Design Procedure

8.2.6.2.1 Shutdown and Soft-Start

A soft-start circuit is used in switching power supplies to limit the input inrush current upon start-up. Without a soft-start circuit, the inrush current can be several times the steady-state load current, and thus apply unnecessary stress to the input source. The LM2611 does not have soft-start circuitry, but implementing the circuit in [Figure 32](#) lowers the peak inrush current. The SHDN pin is coupled to the output through C_{SS} . The LM2611 is toggled between shutdown and run states while the output slowly decreases to its steady-state value. The energy required to reach steady state is spread over a longer time and the input current spikes decrease (see [Figure 33](#) and [Figure 34](#)).

8.2.6.3 Application Curves

Typical Application (continued)

8.2.7 High Duty Cycle and Load Current

Figure 35. LM2611 High Current Schematic

8.2.7.1 Design Requirements

Follow the design requirements in [Cuk Converter With Integrated Switch](#).

8.2.7.2 Detailed Design Procedure

8.2.7.2.1 High Duty Cycle and Load Current Operation

The circuit in [Figure 35](#) is used for high duty cycles ($D > 0.5$) and high load currents. The duty cycle begins to increase beyond 50% as the input voltage drops below the absolute magnitude of the output voltage. R_{FB3} and C_{FF2} are added to the feedback network to introduce a low frequency lag compensation (pole-zero pair) necessary to stabilize the circuit under the combination of high duty cycle and high load currents.

9 Power Supply Recommendations

The power supply must never exceed the absolute maximum rating of the device given in [Absolute Maximum Ratings](#). If the regulator is connected to the input supply through long wires or PCB traces, special care is required to achieve good performance. The parasitic inductance and resistance of the input cables can have an adverse effect on the operation of the regulator. The parasitic inductance, in combination with the low ESR ceramic input capacitors, can form an under-damped resonant circuit. This circuit may cause overvoltage transients at the VIN pin, each time the input supply is cycled on and off.

10 Layout

10.1 Layout Guidelines

- Connection between L1 and SW pin should be kept as short as possible to minimize inductance
- Connection between C_{CUK} and SW should also be kept short
- The feedback resistor should be placed close to the NFB pin to minimize the path of the higher impedance feedback node
- The feedback trace leading from V_{out} to the output to the feedback resistors should not pass under the switch node between L1 and C_{CUK} and the switch node between C_{CUK} , L2 and D
- The feedback trace leading from V_{out} to the output to the feedback resistors should not pass under the inductors L1 and L2
- A bypass capacitor C_{BYP} of 0.1 μF should be placed close to VIN and GND pin

11 Device and Documentation Support

11.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.2 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
